

## Sustainable Development

To face the undoubted reality of climate change, we have adopted an environmental policy.

We permanently study ecological possibilities that we could integrate in our company.

Sustainable development is anchored in our spirits and is part of our everyday-life. From the beginning till the end of our activity, the respect of the environment is omnipresent.

By printing the documents in recto-verso, establishing a separation tank to avoid every liquid to pass through the floors and sorting out the waste, we take care of our planet.

Day by day, we work with this ecological state of mind, to adopt a responsible behaviour in each of our performances.

We have installed our offices in a passive building which means that it consumes very little energy throughout the whole year.

As the movement of the vehicles between the sites and the offices has an impact on the environment by the emissions of CO<sub>2</sub>, we are holding a vehicle park which is respectful to the environment, with vehicles that are having a low CO<sub>2</sub> emission. In this optic, we have divided the Luxembourgish territory by geographical sectors, where each inspector is taking care of his sector on a defined period of time. So we occupy the entire Luxembourgish territory, from the morning till the evening, while having the smallest impact of CO<sub>2</sub> rejection as possible.

The vehicles are equipped with GPRS, so that we can verify that the trips are ideally optimized.

The inspectors are trained on how to manage their working plan in order to be the most efficient in a same geographical zone.

As we use chemical products for our activity, we work essentially with certified ecolabel cleaning products. These products are concentrated and thus less transportation from the manufacturer to our supplier is needed.

We train our cleaning staff on the correct dosage of the products, to avoid an over consumption of the products.

The training also refers to the spraying of the products on the cleaning wipes and not directly onto the surfaces in order to minimize the consumption.

The products are also softer in regard of health.

ÖKOCLEAN 100 is the first vegetal chemical intended for professionals. These are the first maintenance, cleaning and disinfection products that are certified according to the highest environmental standards of Eco-guarantee and so its sustainability is complimentary to ÖKOCLEAN 100, cleaning products which have been developed on based on renewables raw materials for a professional use with excellent cleaning results.

Our staff members are made aware of the respect of the environment, in the way that everybody behaves in an eco-responsible way. Our work inspectors make sure that various rules are applied and respected.

We are still and will always continue to invest ourselves in this environmental approach and search permanently to find ecological alternatives to our working methods.
